SECURITY CLASSIFICATION OF THIS PAGE(When Data Entered)

SECURITY CLASSIFICATION OF THIS PAGE(When Data Entered)

INSTRUCTIONS FOR PREPARATION OF REPORT DOCUMENTATION PAGE

RESPONSIBILITY. The controlling DoD office will be responsible for completion of the Report Documentation Page, DD Form 1473, in all technical reports prepared by or for DoD organizations.

CLASSIFICATION. Since this Report Documentation Page, DD Form 1473, is used in preparing announcements, bibliographies, and data banks, it should be unclassified if possible. If a classification is required, identify the classified items on the page by the appropriate symbol.

COMPLETION GUIDE

Block 1. General. Make Blocks 1, 4, 5, 6, 7, 11, 13, 15, and 16 agree with the corresponding information on the report cover. Leave 2 and 3 blank.

Block 1. Report Number. Enter the unique alphanumeric report number shown on the cover.

Block 2. Government Accession No. Leave Blank. This space is for use by the Defense Documentation Center.

Block 3. Recipient's Catalog Number. Leave blank. This space is for the use of the report recipient to assist in future retrieval of the document.

Block 4. Title and Subtitle. Enter the title in all capital letters exactly as it appears on the publication. Titles should be unclassified whenever possible. Write out the English equivalent for Greek letters and mathematical symbols in the title (see "Abstracting Scientific and Technical Reports of Defense-sponsored RDT/E," AD-667 000). If the report has a subtitle, this subtitle should follow the main title, be separated by a comma or semicolon if appropriate, and be initially capitalized. If a publication has a title in a foreign language, translate the title into English and follow the English translation with the title in the original language. Make every effort to simplify the title before publication.

Block 5. Type of Report and Period Covered. Indicate here whether report is interim, final, etc., and, if applicable, inclusive dates of period covered, such as the life of a contract covered in a final contractor report.

Block 6. Performing Organization Report Number. Only numbers other than the official report number shown in Block 1, such as series numbers for in-house reports or a contractor/grantee number assigned by him, will be placed in this space. If no such numbers are used, leave this space blank.

Block 7. Author(s). Include corresponding information from the report cover. Give the name(s) of the author(s) in conventional order (for example, John R. Doe or, if author prefers, J. Robert Doe). In addition, list the affiliation of an author if it differs from that of the performing organization.

Block 8. Contract or Grant Number(s). For a contractor or grantee report, enter the complete contract or grant number(s) under which the work reported was accomplished. Leave blank in in-house reports.

Block 9. Performing Organization Name and Address. For in-house reports enter the name and address, including office symbol, of the performing activity. For contractor or grantee reports enter the name and address of the contractor or grantee who prepared the report and identify the appropriate corporate division, school, laboratory, etc., of the author. List city, state, and ZIP Code.

Block 10. Program Element, Project, Task Area, and Work Unit Numbers. Enter here the number code from the applicable Department of Defense form, such as the DD Form 1498, "Research and Technology Work Unit Summary" or the DD Form 1634, "Research and Development Planning Summary," which identifies the program element, project, task area, and work unit or equivalent under which the work was authorized.

Block 11. Controlling Office Name and Address. Enter the full, official name and address, including office symbol, of the controlling office. (Equates to funding/sponsoring agency. For definition see DoD Directive 5200.20, "Distribution Statements on Technical Documents.")

Block 12. Report Date. Enter here the day, month, and year or month and year as shown on the cover.

Block 13. Number of Pages. Enter the total number of pages.

Block 14. Monitoring Agency Name and Address (if different from Controlling Office). For use when the controlling or funding office does not directly administer a project, contract, or grant, but delegates the administrative responsibility to another organization.

Blocks 15 & 15a. Security Classification of the Report: Declassification/Downgrading Schedule of the Report. Enter in 15 the highest classification of the report. If appropriate, enter in 15a the declassification/downgrading schedule of the report, using the abbreviations for declassification/downgrading schedules listed in paragraph 4-207 of DoD 6200.1-R.

Block 16. Distribution Statement of the Report. Insert here the applicable distribution statement of the report from DoD Directive 5200.20, "Distribution Statements on Technical Documents."

Block 17. Distribution Statement (of the abstract entered in Block 20, if different from the distribution statement of the report). Insert here the applicable distribution statement of the abstract from DoD Directive 5200.20, "Distribution Statements on Technical Documents."

Block 18. Supplementary Notes. Enter information not included elsewhere but useful, such as: Prepared in cooperation with . . . Translation of (or by) . . . Presented at conference of . . . To be published in . . .

Block 19. Key Words. Select terms or short phrases that identify the principal subjects covered in the report, and are sufficiently specific and precise to be used as index entries for cataloging, conforming to standard terminology. The DoD "Thesaurus of Engineering and Scientific Terms" (TEST), AD-672 000, can be helpful.

Block 20. Abstract. The abstract should be a brief (not to exceed 200 words) factual summary of the most significant information contained in the report. If possible, the abstract of a classified report should be unclassified and the abstract to an unclassified report should consist of publicly-releasable information. If the report contains a significant bibliography or literature survey, mention it here. For information on preparing abstracts see "Abstracting Scientific and Technical Reports of Defense-Sponsored RDT&E," AD-667 000.

ST. LOUIS, MISSOURI 63101

IN REPLY REFER TO

SUBJECT: Busch Wildlife Area Lake No. 35 Dam (Mo. 10092) Phase I
Inspection Report

This report presents the results of field inspection and evaluation of the Busch Wildlife Area Lake No. 35 Dam (Mo. 10092).

It was prepared under the National Program of Inspection of Non-Federal Dams.

This dam has been classified as unsafe, non-emergency by the St. Louis District as a result of the application of the following criteria:

- 1) Spillway will not pass 50 percent of the Probable Maximum Flood
- 2) Overtopping could result in dam failure
- 3) Dam failure significantly increases the hazard to loss of life downstream

MISSOURI INVENTORY NO. 10092

NOVEMBER 1979

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM

Name of Dam: Busch Wildlife Area Lake No. 35 Dam,
Missouri Inv. No. 10092
State Located: Missouri
County Located: St. Charles
Stream: Schote Creek
Date of Inspection: June 15, 1979

Assessment of General Condition

Busch Wildlife Area Lake No. 35 Dam was inspected by the engineering firms of Consoer, Townsend and Associates LTD., and Engineering Consultants, Inc. (A Joint Venture) of St. Louis, Missouri using the "Recommended Guidelines for Safety Inspection of Dams". These guidelines were developed by the Chief of Engineers, U.S. Army, Washington, D.C., with the help of Federal and State agencies, professional engineering organizations, and private engineers. The resulting guidelines are considered to represent a consensus of the engineering profession.

The overall structural condition of the dam appears to be good. The dam does not exhibit signs of structural instability, except for possibly the longitudinal and transverse cracks observed on the crest of the upstream berm which should be investigated. The dam appears adequately maintained.

Based on the criteria in the guidelines, the dam is in the high hazard potential classification, which means that loss of life and appreciable property loss could occur in the event of failure of the dam. The estimated damage zone extends about 1 1/2 miles downstream of the dam. Within the damage zone are seven trailers and a bridge under U.S. Highway 40 which may be subjected to flooding, with possible damage and/or destruction, and possible loss of life. The Busch Wildlife Area Lake No. 35 Dam is in the intermediate size classification since its storage capacity is more than 1,000 acre-feet, but less than 50,000 acre-feet.

Our inspection and evaluation indicates that the spillway of Busch Wildlife Area Lake No. 35 Dam does not meet the criteria set forth in the guidelines for a dam having the above size and hazard potential. Busch Wildlife Area Lake No. 35 Dam being an intermediate size dam, with a high hazard potential, is required by the guidelines to pass the Probable Maximum Flood without overtopping. It was determined that the reservoir/spillway system can accommodate 31 percent of the Probable Maximum Flood without overtopping the dam. Our evaluation indicates that the reservoir/spillway system will accommodate the 100-year flood without overtopping.

The Probable Maximum Flood is defined as the flood discharge that may be expected from the most severe combination of critical meteorological and hydrologic conditions that are reasonably possible in the region. The 100-year flood is defined as a flood having a one percent chance of being equalled or exceeded during any given year.

Other deficiencies noted by the inspection team were: longitudinal and transverse cracks observed on the crest of the upstream berm; severe erosion of the upstream berm; obstruction of the spillway weir; erosion of the side slopes of the spillway

discharge channel; the low level drain did not appear to be in working condition; the seepage observed in the spillway discharge channel; the trees and debris in the downstream channel; a lack of periodic inspection by a qualified engineer and a lack of a maintenance schedule. The absence of seepage and stability analyses on record is also a deficiency.

It is recommended that the owner take action to correct or control the deficiencies described above.

Walter G. Shifrin, P.E.

PHASE I INSPECTION REPORT
NATIONAL DAM SAFETY PROGRAM

Busch Wildlife Area Lake No. 35 Dam, Missouri Inv. No. 10092

SECTION 1: PROJECT INFORMATION

1.1 General

a. Authority

The Dam Inspection Act, Public Law 92-367 of August, 1972, authorizes the Secretary of the Army, through the Corps of Engineers, to initiate a national program of dam inspections. Inspection for the Busch Wildlife Area Lake No. 35 Dam was carried out under Contract DACW 43-79-C-0075 between the Department of the Army, St. Louis District, Corps of Engineers, and the engineering firms of Consoer, Townsend & Associates Ltd., and Engineering Consultants, Inc. (A Joint Venture), of St. Louis, Missouri.

b. Purpose of Inspection

The visual inspection of the Busch Wildlife Area Lake No. 35 Dam was made on June 15, 1979. The purpose of the inspection was to make a general assessment as to the structural integrity and operational adequacy of the dam embankment and its appurtenant structures.

c. Scope of Report

This report summarizes available pertinent data relating to the project; presents a summary of visual observations made during the field inspection; presents an assessment of hydrologic and hydraulic conditions at the site; presents an assessment as to the structural adequacy of the various project features; and assesses the general condition of the dam with respect to safety.

Subsurface investigations, laboratory testing, and detailed analyses were not within the scope of this study. The conclusions drawn herein, therefore, are based on the presence of, or absence of, obvious signs of distress. No warranty as to the absolute safety of the project features is implied by the conclusions presented in this report.

It should be noted that reference in this report to left or right abutments is as viewed looking downstream. Where left abutment or left side of the dam is used in this report, this also refers to northwest abutment or side, and right to the southeast abutment or side.

d. Evaluation Criteria

Criteria used to evaluate the dam were furnished by the Department of the Army, Office of the Chief of Engineers, in "Recommended Guidelines for Safety Inspection of Dams", Appendix D. These guidelines were developed with the help of several Federal agencies and many State agencies, professional engineering organizations, and private engineers.

1.2

Description of the Project

a. Description of Dam and Appurtenances

The dam consists of a homogenous earthfill embankment between an earth abutment on the left side and a rock abutment on the right side. The crest is 14 feet wide and 930 feet long as shown on available drawings. The crest elevation is 563.5 feet above MSL. The maximum height of the embankment is 35 feet.

The upstream slope was constructed with either a 1V to 3H or a 1V to 2.5H slope from the crest to elevation 558.0 according to the available drawings. From field measurements, the slope was found to be 1V to 3.75H. At elevation 558.0, a 20-foot wide berm was constructed. From elevation 558.0 to the streambed elevation, the slope is either 1V to 3H or 1V to 2.5H according to the available drawings. The upstream slope has riprap protection on it below elevation 558.0 which was not shown on the design drawings. The riprap ranges in size from 2 inches to 24 inches.

The downstream slope is constructed with a 1V to 2.5H slope from the crest to elevation 540.0. At elevation 540.0, a 20-foot wide berm is constructed. From elevation 540.0 to the original ground, the slope is 1V to 2.5H.

The dam is located near the southern edge of the Dissected Till Plains Section of the Central Lowlands Province (Fenneman, N.M., "Physiographic of Eastern United States", 1946). In the area of the dam site, overlaying the glacial till, is a considerable amount of loess. However, much of the surficial material in the vicinity of the dam has been eroded. The area is characterized by gently rolling hills.

Regionally, the rocks are dipping gently about 40 feet per mile to the northeast off of the Ozark Uplift to the south. The rocks in the area range in age from Ordovician to Mississippian.

According to the design drawings, the spillway weir, the spillway channels and the right abutment are founded on bedrock. Approximately the right one third of the dam is founded on the bedrock and the rest of dam is founded on the surficial material overlaying the bedrock, according to the design drawings.

A cutoff trench, with side slopes of 1H to 1V, and a base width of 10 feet, was excavated parallel to the dam axis across the entire dam according to the available drawings. From near the right abutment toward the left abutment for approximately 135 feet, the trench was excavated to or into the rock foundation.

There is only one spillway for the Busch Wildlife Area Lake No. 35 Reservoir. The spillway is cut into the right abutment. The spillway consists of a straight drop concrete rectangular weir with a crest length of 50 feet. From the crest of the weir, there is a 3.5 foot vertical drop to a 3.5 foot wide concrete apron which abuts the rock in the discharge channel. The elevation of the crest of the weir is 557 feet above MSL. The spillway channels consist of an approach channel and a discharge channel. The approach channel, which has a 50-foot wide bottom and is approximately 100 feet in length, is excavated to rock. The side slopes of the approach channels are 1V to 3H. The discharge channel has a 50-foot wide bottom and is approximately 270 feet in length and is excavated into the rock. The side slopes of the discharge channel vary from near vertical to 1V to 3H.

A low level outlet drain pipe was provided for the reservoir. The intake is at elevation 536.0 and the discharge is at elevation 531.0 according to the available drawings. The pipe is a 12-inch inside diameter C.I.P. located approximately 335 feet from the right abutment. The outlet is controlled by a gate valve which is located 40 feet upstream from the outlet of the pipe.

b. Location

Busch Wildlife Area Lake No. 35 Dam is located on Schote Creek which flows northeasterly from the dam for approximately 2.5 miles into Dardenne Creek, St. Charles County, Missouri (Plate 1). The nearest downstream community is a trailer park which is approximately 0.7 miles downstream of the dam. The dam and reservoir are shown on the Weldon Springs Quadrangle Sheet (7.5 minute series) in Township 46 North, Range 2 East (Plate 1, Appendix B). The dam was located by the U.S. Survey No. 1669 as being 10,930 feet northwest and 53 feet southwest from the southwest corner of Section 30, Township 46 North, Range 3 East.

c. Size Classification

According to the "Recommended Guidelines for Safety Inspection of Dams", by the U.S. Department of the Army, Office of the Chief Engineer, the dam is classified in the dam size category as being "Small" since its height is less than 40 feet. The dam is classified as "Intermediate" in dam size category because its storage is more than 1,000 acre-feet but less than 50,000 acre-feet. The overall size classification is governed by the larger of the two determinations, and the classification is, accordingly, "Intermediate" in size.

d. Hazard Classification

The dam has been classified as having "High" hazard potential in the National Inventory of Dams, on the basis that in the event of failure of the dam or its appurtenances, excessive damage could occur to downstream property, together with the possibility of the loss of life. Our findings concur with the classification. The estimated damage zone extends about 1 1/2 miles downstream of the dam. Within about 0.7 miles downstream from the dam are seven trailers and a bridge under U.S. Highway 40.

e. Ownership

Busch Wildlife Area Lake No. 35 Dam is owned by the Missouri Department of Conservation Commission. The mailing address is Missouri Department of Conservation Commission, c/o Mr. Leroy Heman, Box 180, Jefferson City, Missouri 65102.

f. Purpose of Dam

The purpose of the dam is to impound water for recreational use.

g. Design and Construction History

Busch Wildlife Area Lake No. 35 Dam was designed in May, 1962 by the Missouri Conservation Commission located in Jefferson City, Missouri. According to Mr. Calsady of Busch Wildlife Area, the dam was built in the latter part of 1962 and early part of 1963 by a local contractor named Bernow McMememy. Efforts to locate or contact the contractor were futile.

h. Normal Operational Procedures

Normal procedure for Busch Wildlife Area Lake No. 35 Dam is to allow the reservoir to remain as full as possible with the water level being controlled by rainfall, runoff, evaporation, seepage and the elevation of the spillway crest.

SECTION 2 : ENGINEERING DATA

2.1 Design

Design drawings are available for the dam from the Missouri Conservation Commission in Jefferson City, Missouri and are included as part of this report. The drawings were prepared in May of 1962 by the Missouri Conservation Commission. No specifications, engineering computations or soil data for this project were available.

2.2 Construction

No data is available concerning the construction of the dam and appurtenant structures, other than the construction history given in Section 1.2g.

2.3 Operation

No operation records are available for the Busch Wildlife Area Lake No. 35 Dam.

2.4 Evaluation

a. Availability

The availability of engineering data is poor and consists only of the design drawings mentioned in Section 2.1, State Geological Maps and U.S.G.S. Quadrangle Sheets. No information on subsurface investigations or soil testing was

available. No information on design hydrology or hydraulic design was available, nor were seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams", which is considered a deficiency.

b. Adequacy

The conclusions presented in this report are based on field measurements, the available engineering data, past performance and present condition of the dam. The data available is adequate to evaluate the hydraulic and hydrologic capabilities of the dam. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available, which is considered a deficiency. These seepage and stability analyses should be performed for appropriate loading conditions and made a matter of record.

c. Validity

Only a set of design drawings was available for review. From field measurements, the dam appears to have been constructed according to the available drawings, except for the discrepancies described in Section 1.2a. Busch Wildlife Area Lake No. 35 Dam was originally Busch Area Lake No. 41 according to the design drawings provided by the Missouri Conservation Commission.

SECTION 3: VISUAL INSPECTION

3.1 Findings

a. General

A visual inspection of the Busch Wildlife Area Lake No. 35 Dam was made on June 15, 1979. The following persons were present during the inspection:

| <u>Name</u> | <u>Affiliation</u> | <u>Disciplines</u> |
|--------------------|----------------------------------|-------------------------------------|
| David J. Kerkes | Engineering Consultants, Inc. | Soils |
| Peter Howard | Engineering Consultants, Inc. | Geology |
| Mark R. Haynes | Engineering Consultants, Inc. | Civil, Structural and Mechanical |
| Kenneth L. Bullard | Engineering Consultants, Inc. | Hydraulics and Hydrology |
| Kevin Blume | Consoer, Townsend & Assoc., Ltd. | Civil and Structural |

Specific observations are discussed below.

b. Dam

The crest of the dam is protected against surface erosion by a well maintained cover of grass. There was no evidence of significant settlement or cracking on the crest. No significant deviations in horizontal or vertical alignment were apparent. There was no evidence of the dam ever being overtopped.

The upstream slope from the crest to the berm was protected from surface erosion by a well maintained cover of grass. No depressions or settlements were apparent on the slope. The upstream edge of the crest of the berm was severely eroded due to wave action. The slope below the berm was protected by riprap. The riprap appeared to have been added after initial construction because of the damage to the crest of the berm due to wave action. No provisions for riprap protection appeared on the design drawings.

Continuous longitudinal and transverse cracks along most of the crest of the upstream berm were observed. The cracks were up to approximately 1 inch wide and up to approximately 12 inches in depth.

The downstream slope of the embankment and the downstream berm were protected from surface erosion by a well maintained cover of grass. No depressions, bulges or settlements were apparent on the downstream slope. No seepage was apparent along the toe of the slope. Materials removed immediately below the vegetation cover on the embankment appeared to be a clayey silt.

No signs of rodent activity in either the embankment or the abutments were apparent.

At the dam site, bedrock was exposed along the edge of the reservoir upstream of the right abutment and in the spillway channels. The rock is a gray, dense, cherty, bedded limestone. The limestone is part of the Burlington-Keokuk limestone formation (Geologic Map of Missouri, 1979). No dip could be measured in the beds in the vicinity of the dam.

c. Appurtenant Structures

(1) Spillways

The concrete rectangular weir structure is in good condition. No spalling or cracking of the concrete was observed. A tree was growing just upstream of the weir. The tree appeared to be collecting debris and may cause any flow over the weir to erode the backfill from behind the structure.

The approach channel to the weir was heavily covered with grass and was not obstructed. Several exposures of limestone bedrock were observed in the channel. No indication of instability in the slopes was apparent.

The discharge channel was excavated into the limestone bedrock. The channel was not obstructed. Seepage was observed in several areas of the channel approximately 75 feet to 200 feet downstream of the weir. The seepage appears to be flowing in the bedding planes of the limestone and the total flow of the seeps is estimated to be less than 1 gpm. The side slopes of the channel were eroded just downstream of the weir. The slopes beyond the eroded area appear to be stable.

(2) Outlet Works

The outlet of the 12-inch diameter C.I.P. low level drain was observed. No seepage through or around the pipe was apparent. The inlet to the pipe was not located. The gate valve housing was located, however, the valve control could not be seen due to the debris on top of it.

d. Reservoir Area

The water surface elevation was approximately 554 feet above MSL on the day of the inspection.

The reservoir rim is gently sloped and no indications of instability or severe erosion were readily apparent. The slopes above the reservoir on the south and the east sides were heavily wooded and on the north and the west sides were grassy. No houses were built around the reservoir rim.

e. Downstream Channel

The downstream channel of the spillway is a well-defined, open channel. The channel was obstructed by several trees and large piles of rock. Approximately 200 feet downstream of the end of the discharge channel, the channel flows through a concrete box culvert. The culvert has two barrels which are approximately 20 feet high by 10 feet wide. U.S. Highway 40 travels over this box culvert.

3.2 Evaluation

The visual inspection did not reveal any items which are sufficiently significant to indicate a need for immediate remedial action.

The following deficiencies were observed which could affect the safety of the dam or which will require maintenance within a reasonable period of time.

1. The erosion of the upstream berm crest above the riprap protection, if allowed to continue, could jeopardize the structural stability of the embankment.
2. The tree just upstream of the weir poses an obstruction to the normal operation of the spillway and thus jeopardizes the safety of the dam.
3. The erosion of the backfill upstream of the weir could jeopardize the structural stability of the weir.
4. The erosion of the side slopes of the discharge channel just downstream of the weir, if allowed to continue, could jeopardize the structural stability of the weir.
5. The seepage observed in the discharge channel could pose a danger to the safety of the dam.
6. The obstructions in the downstream channel of the spillway will reduce the hydraulic efficiency of the channel.

7. It is unknown whether the cracks observed on the crest of the upstream berm are indicative of shrinkage, slope movement or foundation settlement. The observed cracks should be further investigated to insure that they are not symptomatic of distress in the slope or foundation.

SECTION 4: OPERATIONAL PROCEDURES

4.1 Procedures

Busch Wildlife Area Lake No. 35 Dam is used primarily for recreational use. It is part of the August A. Busch Memorial Wildlife Area which is a state owned and operated park. The only operating facility is a 12-inch diameter low level lake drain. The water level in the lake is allowed to remain as full as possible, and is controlled by rainfall, runoff, evaporation and the elevation of the spillway crest.

4.2 Maintenance of Dam

The dam is maintained by personnel employed by Busch Wildlife Area. The downstream and upstream slopes of the embankment are kept mowed and free of trees and brush. There appears to have been no major repairs to the dam itself since its original construction except for possibly the riprap protection placed on the upstream slope which did not appear on the original design drawings.

4.3 Maintenance of Operating Facilities

The only facility located at the damsite which requires any operation is the 12-inch diameter low level lake drain. The control, a gate valve, is located 40 feet upstream from the downstream end of the drain. The gate valve was inaccessible at the time of the inspection due to debris covering it.

4.4 Description of Any Warning System in Effect

The inspection team is not aware of any existing warning system in effect.

4.5 Evaluation

The maintenance at Busch Wildlife Area Lake No. 35 Dam appears to be adequate, however, the remedial measures as described in Section 7 should be undertaken.

SECTION 5: HYDRAULIC/HYDROLOGIC

5.1 Evaluation of Features

a. Design

Busch Wildlife Area Lake No. 35 Dam has a watershed of 2,107 acres. Two upstream dams are located above Busch Wildlife Area Lake No. 35 Dam. A drainage map showing the watershed area and the location of the three dams is presented as Plate 1 in Appendix B. The watershed areas of Upstream Dams #1, and #2 are 228 and 809 acres, respectively. The reservoirs of the Upstream Dam #1 and Upstream Dam #2 drain into Busch Wildlife Area Lake No. 35 Dam. The watershed area between Busch Wildlife Area No. 35 Dam and Upstream Dams #1 and #2 is 1,070 acres. Busch Wildlife Area Lake No. 35 Dam is located on Schote Creek. The dam is about 2.25 miles upstream from the confluence of the Schote Creek and Dardenne Creek.

Evaluation of the hydraulic and hydrologic features of Busch Wildlife Area Lake No. 35 Dam was based on criteria set forth in the Corps of Engineers' "Recommended Guidelines for Safety Inspection of Dams", and additional guidance provided by the St. Louis District of the Corps of Engineers. The Probable Maximum Flood (PMF) was calculated from the Probable Maximum Precipitation (PMP) using the methods outlined in the U.S. Weather Bureau Publication, Hydrometeorological Report No. 33. The probable maximum storm duration was set at 24 hours, and storm rainfall distribution was based on criteria given in EM 1110-2-1411 (Standard Project Storm). The SCS method was used for deriving the unit hydrographs,

utilizing the Corps of Engineers' computer program HEC-1 (Dam Safety Version). Three unit hydrographs, one for each of the three dams were derived. The parameters of the unit hydrographs are presented in Appendix B. The SCS method was used for determining the loss rate. The hydrologic soil group of the watershed was determined by use of the published soil maps. The hydrologic soil group of the watershed and the SCS curve number are also presented in Appendix B. The curve number, unit hydrograph parameters, and the PMP rainfall were directly input to the HEC-1 (Dam Safety Version) computer program to obtain the PMF hydrographs. The computed peak discharges of the PMF for Upstream Dams #1 and #2, and Busch Wildlife Area Lake No. 35 Dam are 3,021, 9,772 and 12,119 cfs, respectively. The computed peak discharges for one-half of the PMF for the three dams are one-half of the PMF values.

Both the PMF and one-half of the PMF inflow hydrographs at the upstream dams were routed through the upstream reservoirs by the Modified Puls Method, also utilizing the HEC-1 (Dam Safety Version) computer program. The peak outflow discharges for the PMF and one-half of the PMF at Upstream Dam #1 are 2,866 and 1,424 cfs, respectively. The peak outflow discharges for the PMF and one-half the PMF at Upstream Dam #2 are 8,609 and 3,886 cfs, respectively. The outflow hydrographs at Upstream Dams #1 and #2 were combined with the inflow hydrograph for Busch Wildlife Area Lake No. 35 Dam. The combined inflow discharges for the PMF and one-half of the PMF for Busch Wildlife Area Lake No. 35 Dam are 23,318 cfs and 11,072 cfs, respectively. The combined hydrographs for both the PMF and one-half of the PMF, were routed through Busch Wildlife Area Lake No. 35 Dam. The peak outflow discharges for the PMF and one-half of the PMF at Busch Wildlife Area Lake No. 35 Dam are 20,402 and 7,935 cfs, respectively. Both the PMF and one-half of the PMF when routed through the Busch

Wildlife Area Lake No. 35 Dam reservoir resulted in overtopping of the dam.

The stage-outflow relation for the spillway was prepared from field notes and sketches prepared during the field inspection, and some limited design drawings. The reservoir stage-capacity data were based on the U.S.G.S. Weldon Spring, Missouri Quadrangle topographic map (7.5 minute series). The spillway and overtop rating curve and the reservoir capacity curve for Busch Wildlife Area Lake No. 35 Dam are presented as Plates 2 & 3, respectively in Appendix B.

From the standpoint of dam safety, the hydrologic design of a dam aims at avoiding overtopping. Overtopping is especially dangerous for an earth dam because the downrush of waters over the crest can erode the dam embankment and release all the stored water suddenly into the downstream floodplain. The safe hydrologic design of a dam requires a spillway discharge capability, in combination with an embankment crest height that can handle a very large and exceedingly rare flood without overtopping.

The Corps of Engineers designs its dams to safely pass the Probable Maximum Flood that is estimated could be generated from the upstream watershed. This is the generally accepted criterion for major dams throughout the world, and is the standard for dam safety where overtopping would pose any threat to human life. According to the Corps criteria, the hydrologic requirement for safety for this dam is the capability to pass the Probable Maximum Flood without overtopping.

b. Experience Data

It is believed that no records of reservoir stage or spillway discharge are maintained for this site.

c. Visual Observations

Observations made of the spillway during the visual inspection are discussed in Section 3.1c(1) and evaluated in Section 3.2.

d. Overtopping Potential

As indicated in Section 5.1a, both the Probable Maximum Flood and one-half of the Probable Maximum Flood, when routed through the reservoir, result in overtopping of the dam. The peak outflow discharges for the PMF and one-half of the PMF are 20,402 cfs and 7,935 cfs, respectively. The PMF overtopped the dam crest by 3.20 feet and one-half of the PMF overtopped the dam crest by 1.36 feet. The total duration of embankment overflow is 5.50 hours during the PMF, and 2.92 hours during one-half of the PMF. The spillway and the reservoir of Busch Wildlife Area Lake No. 35 Dam is capable of accommodating a flood equal to approximately 31 percent of the PMF just before overtopping the dam. The spillway/reservoir system of Busch Wildlife Area Lake No. 35 Dam will accommodate the 100-year flood without overtopping.

The failure of the dam could cause extensive damage to the property downstream of the dam and possible loss of life. The estimated damage zone extends about 1 1/2 miles downstream of the dam. Within the damage zone are seven trailers and a bridge under U.S. Highway 40.

SECTION 6: STRUCTURAL STABILITY

6.1 Evaluation of Structural Stability

a. Visual Observations

Extensive longitudinal and transverse cracks were observed on the crest of the upstream berm. Many cracks were continuous over large areas. The maximum width was about 1 inch with measured depths to 12 inches. There were no other signs of settlement or distress observed on the embankment or foundation during the visual inspection.

The severe erosion of the upstream berm due to wave action was not serious enough to constitute an unsafe condition at this time. The erosion of the upstream berm was above the riprap protection, which made it appear that the riprap protection was placed on the upstream slope after the erosion occurred.

The spillway weir did not show any structural instability at this time. Nevertheless, the tree and the erosion of the backfill just upstream of the weir and the erosion of the side slopes of the discharge channel just downstream of the weir may pose a danger to the structural stability of the weir in the future.

The low level lake drain did not show any sign of structural instability. Nevertheless, the gate valve should be operated to determine if it is operable and verify that drain is not clogged. If the drain does not function, necessary repairs should be made in case the reservoir has to be lowered for any reason.

The seepage through the limestone in the discharge channel does not pose a danger to the stability of the dam in its present condition. Nevertheless, the seepage should be monitored because there is possibility that the seepage channels could be enlarged by solution.

The limestone bedrock is a competent and satisfactory foundation for the dam, the spillway weir and the spillway channels.

b. Design and Construction Data

No design computations were uncovered during the report preparation phase. Seepage and stability analyses comparable to the requirements of the "Recommended Guidelines for Safety Inspection of Dams" were not available. No embankment or foundation soil parameters are available for carrying out a conventional stability analysis on the embankment. No construction data or specifications relating to the degree of embankment compaction are available for use in a stability analysis.

c. Operating Records

No operating records are available relating to the stability of the dam or appurtenant structures. The water level on the day of inspection was 3 feet below the crest of spillway weir and it is assumed that the reservoir remains close to full at all times. The low level lake drain should be operated as described in Section 6.1a.

d. Post Construction Changes

No post construction changes exist which will affect the structural stability of the dam, except for possibly the riprap protection placed on the upstream slope which did not appear on the original design drawings.

e. Seismic Stability

The dam is located in Seismic Zone 2, as defined in "Recommended Guidelines for Safety Inspection of Dams" as prepared by the Corps of Engineers, and therefore, does not require a seismic stability analysis.

SECTION 7: ASSESSMENT/REMEDIAL MEASURES

7.1 Dam Assessment

The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I investigation; however, the investigation is intended to identify any need for such studies.

It should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team.

It is also important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there be any chance that an unsafe condition could be detected.

a. Safety

The spillway capacity of Busch Wildlife Area Lake No. 35 Dam was found to be "Seriously Inadequate". The spillway/reservoir system will accommodate only 31 percent of the PMF without overtopping the dam. The spillway and the reservoir will accommodate the 100-year flood without overtopping.

If loess indeed constitutes a portion of the foundation as the geology of the area indicates, it is quite possible that the cracking is a result of settlement in the foundation. An increase in the water content of the loess as the reservoir filled could induce considerable post construction settlement since wetting has a radical affect on the consolidation properties of loess. Therefore, without further investigation, it is not possible to determine whether the cracks are due to settlement, shrinkage, or are symptomatic of distress in the slope.

The severe erosion of the upstream berm above the riprap protection due to wave action should be repaired and protected within a reasonable period of time. The dam embankment appears to be in good structural condition, except for possibly the cracking as described above. No seepage and stability analyses were available for review.

The tree and the erosion of the backfill just upstream of the weir and the erosion of the side slopes of the discharge channel just downstream of weir pose a potential danger to the safety of the dam and an obstruction to the normal operation of the spillway. These conditions should be repaired and protected within a reasonable period of time.

The seepage observed in the discharge channel of the spillway does not pose a danger to the safety of the dam in its present condition. However, the seepage should be monitored for any changes in quantity, location or color and any changes reported.

The trees and debris in the downstream channel of the spillway should be removed. The channel should be kept clean of trees and debris.

b. Adequacy of Information

The conclusions presented in this report are based on field measurements, the available engineering data, past performance and present condition of the dam. Information on the design hydrology, hydraulic design, and the operation and maintenance of the dam as well as seepage and stability analyses were not available.

c. Urgency

A program should be developed as soon as possible to monitor at regular intervals the deficiencies described in this report. The remedial measures recommended in Paragraph 7.2 should be accomplished in the near future. The item recommended in Paragraph 7.2a should be pursued on a high priority basis.

d. Necessity for Phase II Inspection

Based on results of the Phase I inspection, and if the remedial measures recommended in Paragraph 7.2 are undertaken as soon as possible, a Phase II inspection is not felt to be necessary.

7.2 Remedial Measures

The following remedial measures should be performed under the guidance of an engineer experienced in the design and construction of earth dams.

a. Alternatives:

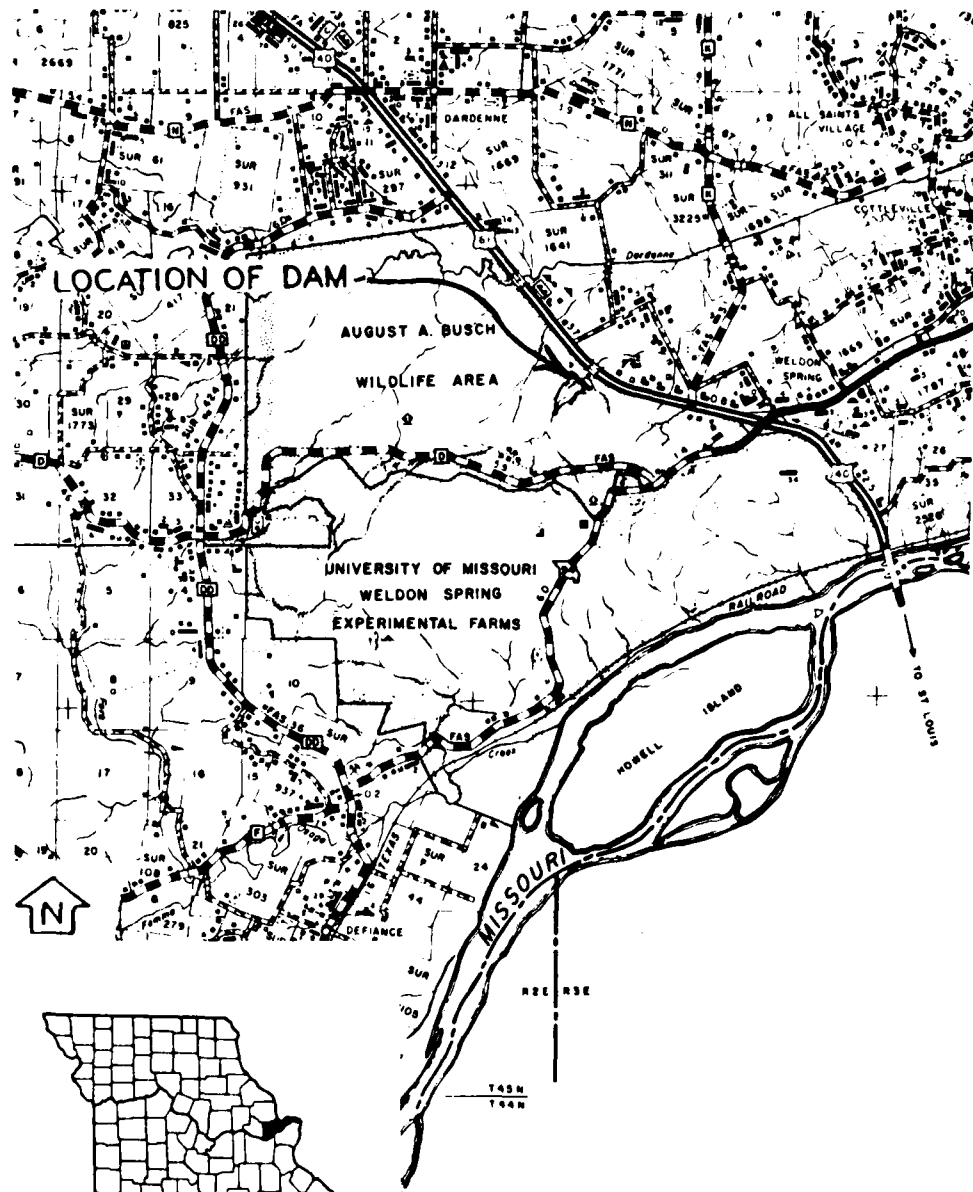

Spillway capacity and/or height of the dam should be increased to accommodate the PMF without overtopping the dam. The overtopping depth during the occurrence of the PMF, stated elsewhere in this report is not the required or recommended increase in height of the dam.

b. O & M Procedures:

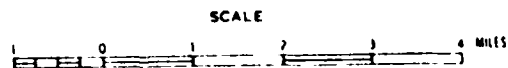

1. The observed cracking should be further investigated to insure that it is not symptomatic of distress in the slope. Large cracks should be trenched and properly backfilled.
2. Repair erosion due to wave action on the upstream slope and protect the slope from further damages.
3. Remove the tree and repair the erosion just upstream of the spillway weir.
4. Repair the erosion of the side slopes of the discharge channel just downstream of the spillway weir.
5. Remove the obstructions in the downstream channel of the spillway.

6. Seepage and stability analyses should be performed by a professional engineer experienced in the design and construction of earthen dams.
7. Monitor the seepage in the discharge channel for any changes in quantity, location or color and report any changes.
8. The owner should initiate the following programs:
 - (a) Periodic inspection of the dam by a professional engineer experienced in the design and construction of earthen dams.
 - (b) Set up a maintenance schedule and log all visits to the dam for operation, repairs and maintenance.

44. *Phragmites australis* (Cav.) Trin. ex Steud.

James Earl Ray, Jr. was born on May 19, 1928, in Jackson, Mississippi. He was the son of James Earl Ray, Sr. and Lillian Ray. He was raised in a family of five children. He attended the University of Mississippi and graduated with a degree in Business Administration. He then worked for the Mississippi Power and Light Company. He was later involved in a series of events that led to his conviction for the murder of Dr. Martin Luther King Jr. in 1968. He was sentenced to 99 years in prison. He was later released and moved to the United Kingdom, where he lived under the name Eric Starvo Galt. He was eventually captured and returned to the United States, where he was sentenced to death. He was executed by hanging on April 3, 1979.

1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 26

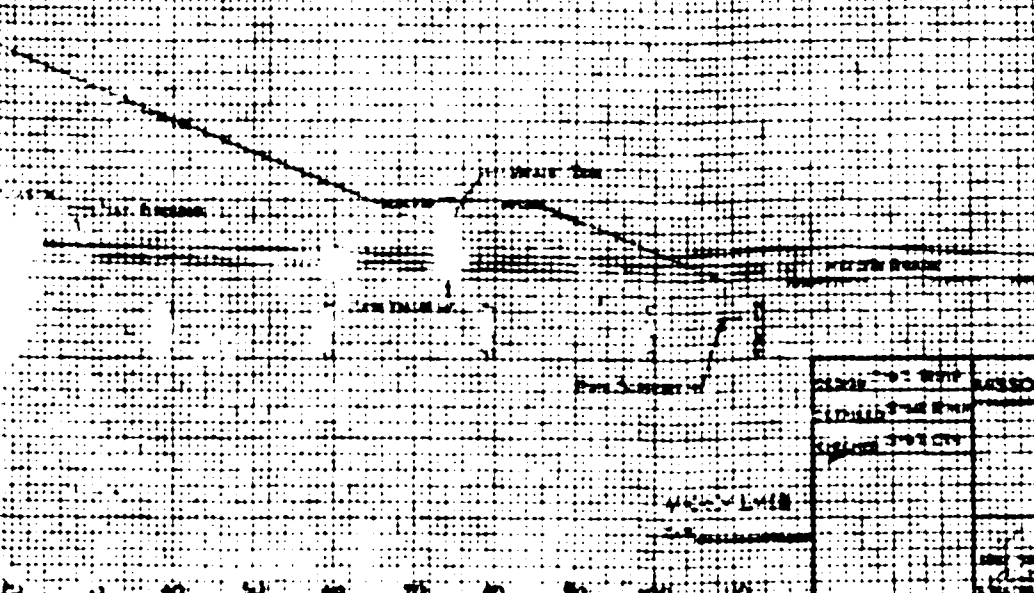

On 17 February 1992, the following information was received from the U.S. Coast Guard:

DAM SAFETY INSPECTION - MISSOURI

SHEET NO. 1 OF

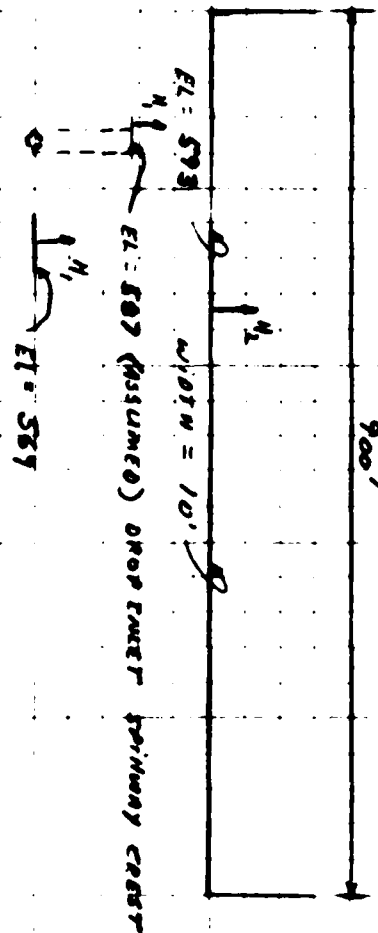

U/S DAM #1 (10093) TO BUSCH LAKE DAM #35

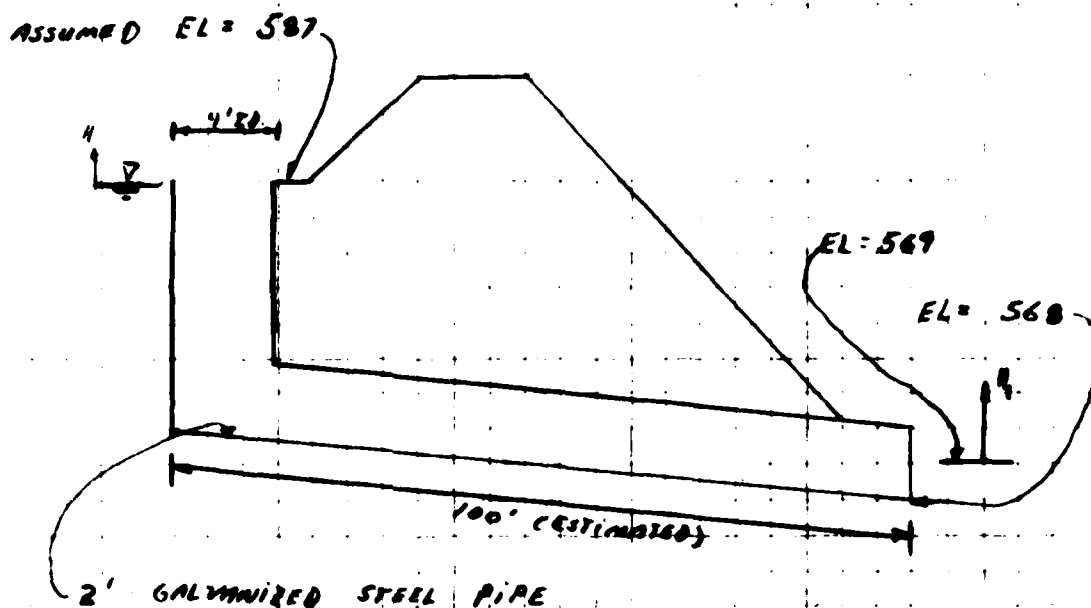

JOB NO. 1240-001

SPILLWAY AND OVERTOP RATING CURVE

BY HLB DATE 6-21-7

| RESERVOIR WATER SURFACE ELEV. | H ₁ | Multiple Spillway Q ₁ (390 ft) | C ₂ | L ₂ | H ₂ | Q ₂ (54 ft) | Q _T = Q ₁ + Q ₂ |
|--|----------------|---|----------------|----------------|----------------|------------------------|--|
| 587 | 1.8 | - | - | - | - | - | 0 |
| 588 | 20 | 62 | - | - | - | - | 62 |
| 591 | 22 | 65 | - | - | - | - | 65 |
| 593 | 24 | 68 | - | - | - | - | 68 |
| 595 | 26 | 71 | 2.64 | 100 | 1 | 6720 | 6791 |
| 596 | 27 | 72 | 2.64 | 100 | 3 | 12346 | 12418 |

ASSUME NO TAIL WATER EFFECTS.

AT WL = 589, H = 2

a) WEIR FLOW

$$Q = CLH^{3/2} = 3.03 \times (\pi \times 4) \times 2^{3/2} = 108 \text{ cfs.}$$

b) PRESSURE FLOW

$$\text{ASSUME } E = 0.017 \Rightarrow S_f = 0.00825 \Rightarrow f = 0.036 \text{ \& } K_e = 0.$$

$$H_f = (1.0 + K_e + f \frac{L}{D}) \frac{V^2}{2g}$$

$$H_f = (1.0 + 0.5 + 0.036 \frac{100}{2}) \frac{V^2}{2g}$$

$$H_f = 3.30 \frac{V^2}{2g}, \Rightarrow V = 9.42 \sqrt{H_f}$$

DAM SAFETY INSPECTION - MISSOURI SHEET NO. 3 OF
U/S DAM #1 (BUSCH 36) TO BUSCH LAKE DAM #35 JOB NO. 1290
PRINCIPLE SPILLWAY RATING CURVE BY HLB DATE 6-21-71
MAB

$$Q = A \cdot V = \pi \frac{D^2}{4} \times 4.42 \sqrt{H_f}$$

$$Q = 13.90 \sqrt{H_f}$$

$$H_f = 689 - 669 = 20$$

$$Q = 13.90 \sqrt{20} = \underline{62} \text{ CFS}$$

∴ AT ELEV 589 PRESSURE FLOW
CONTROLS AND $Q = \underline{62} \text{ CFS}$

ALSO FOR ALL ELEVATIONS ABOVE 589

PRESSURE FLOW WILL CONTROL AND

THE EQUATION $Q = 13.90 \sqrt{H_f}$

WILL BE USED.

* WEIR FLOW CONTROLS

DAM SAFETY INSPECTION - MISSOURI

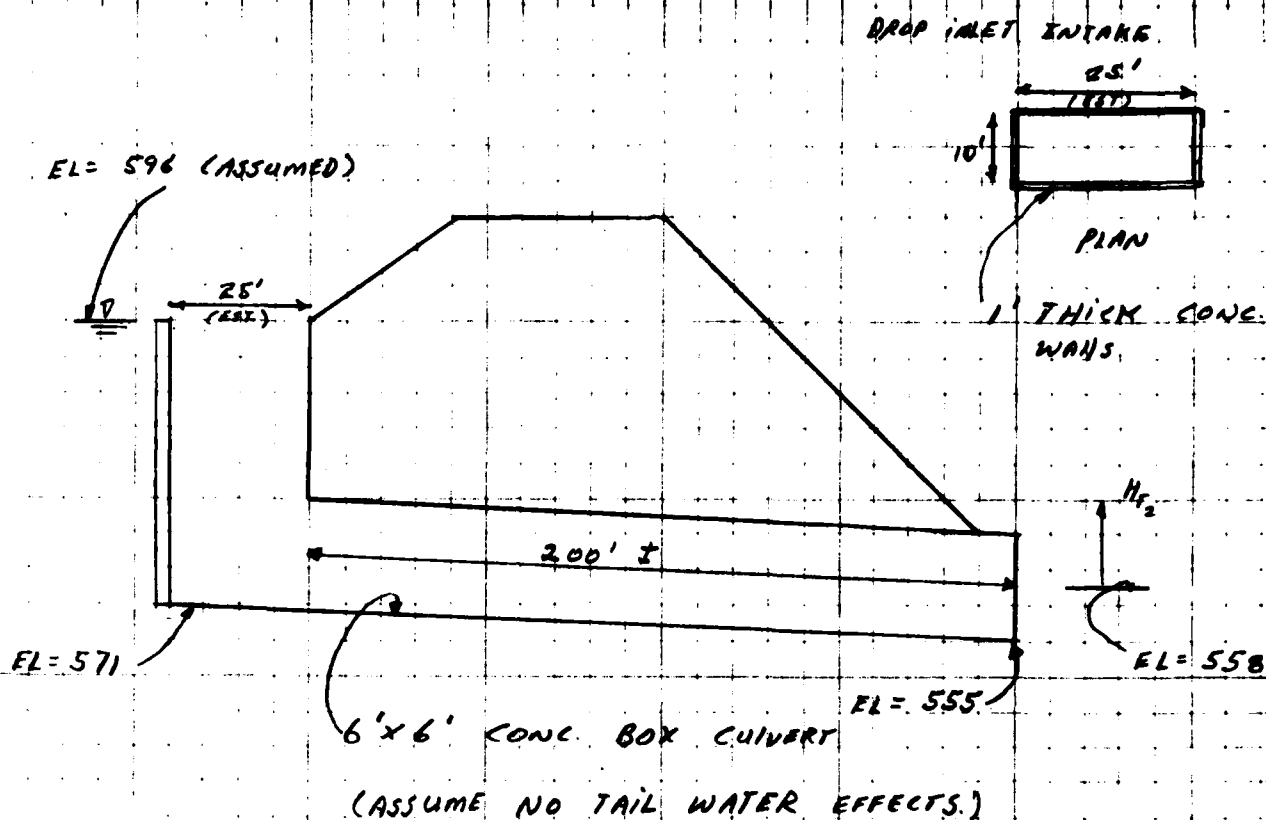

SHEET NO. 2 OF

U/S DAM #2 (BUSCH ANN. MEM. LAKE) TO BUSCH LAKE #85 DAM JOB NO. 1740-001

SPILLWAY RATING CURVE

BY HLB DATE 6-23

V.M.S.

AT W.L. = 598

a) WEIR FLOW ASSUME $C = 3.30$

$$Q = CLH^{3/2}$$

$$L = (25 + 10) \times 2 = 70'$$

$$H = 598 - 596 = 2'$$

$$Q = 3.3 \times 70 \times 2^{3/2} = 653 \text{ CFS.}$$

b) PRESSURE FLOW

$$\text{ASSUME } m = 0.012 \Rightarrow f = 0.017 \quad K_e = 0.5$$

$$H_{T2} = \left(1.0 + 0.5 + f \frac{L}{D} \right) \frac{V^2}{2g}$$

$$H_{T2} = (1.0 + 0.5 + 0.017 \frac{200.8}{4R}) \frac{V^2}{2g}$$

$$R = \frac{A}{P} = \frac{6 \times 6}{4 \times 6} = 1.5$$

$$H_{T2} = (1.0 + 0.5 + 0.017 \frac{200.8}{4 \times 1.5}) \frac{V^2}{2g}$$

$$H_{T2} = 2.07 \frac{V^2}{2g}, \Rightarrow V = 5.58 \sqrt{H_{T2}}$$

$$Q_2 = A_2 V = (6 \times 6) \times 5.58 \sqrt{H_{T2}} = 200.8 \sqrt{H_{T2}}$$

$$H_{T2} = 598 - 558 = 40'$$

$$Q_2 = 200.8 \sqrt{40} = 1279 \text{ CFS} < 653 \text{ CFS}$$

∴ AT ELEV = 598 WEIR FLOW CONTROLS

AND $Q_2 = 653 \text{ CFS}$.

At W.L. = 600

a) Weir flow: $Q = 3.3 \times 70 \times 4^{3/2} = 1848 \text{ cfs}$.

b) Pressure flow:

$$Q = 200.8 \sqrt{42} = 1301 \text{ cfs}$$

Pressure flow controls:

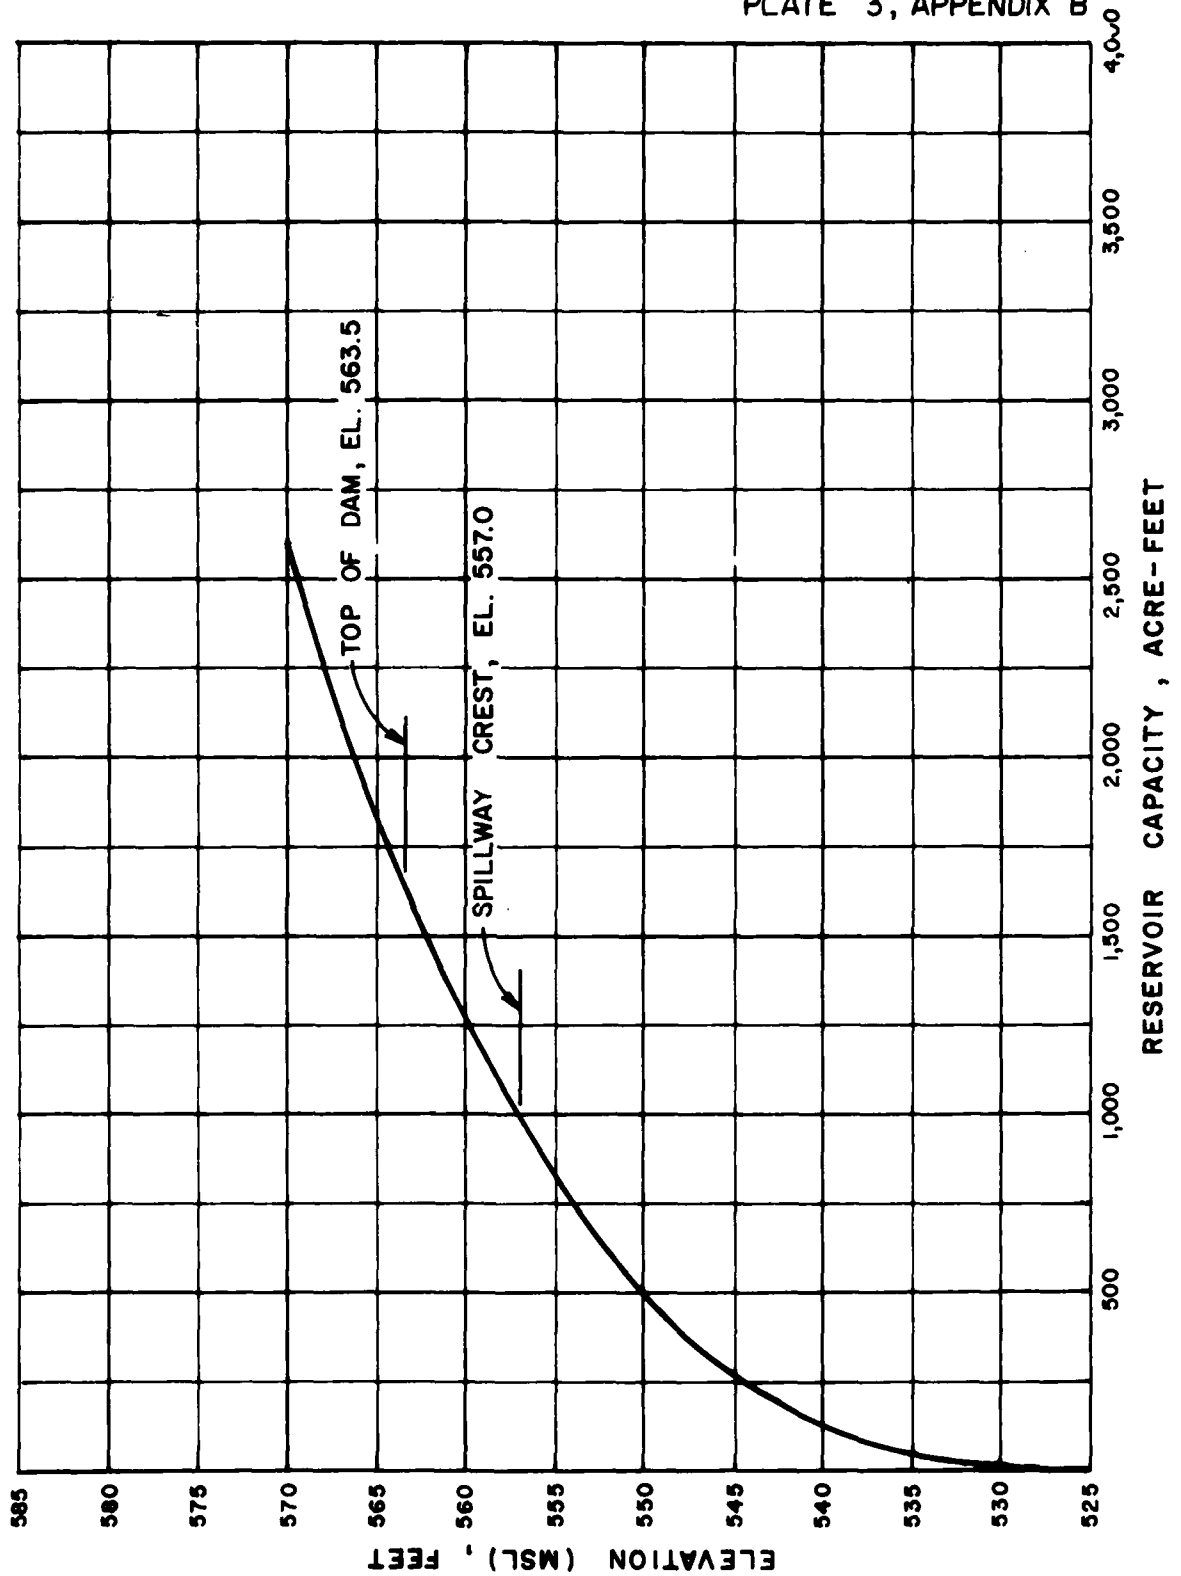

Thus $Q = 1301 \text{ cfs}$.

Use $Q = 200.8 \sqrt{H_{T2}}$ for water levels above 600.
